

PROTECT & RECOVER

Backup & Recovery

Decide what needs protection, how long to retain it and how a restore will be checked.

Connect backup choices to the data and systems your business needs to recover.

A useful starting point for

Businesses reviewing Microsoft 365, endpoint, server or cloud workload protection and recovery readiness.

What we can scope

- Identify critical data, applications and supported workloads.
- Agree retention, storage-location and access requirements.
- Define monitoring, alert follow-up and exception ownership.
- Plan restore checks and document recovery responsibilities.
- Review protection requirements as systems and data volumes change.

Your written quote confirms the selected inclusions.

Understand the proposal**Protection & storage**

Product licensing and storage depend on the selected workloads, retention and measured usage.

Management

Monitoring, exception follow-up and scheduled checks are included only where agreed.

Recovery work

Restore exercises and incident recovery need clear inclusion, authorisation and charging rules.

Clear expectations

- A successful backup report alone does not establish that every required system can be recovered.
- Recovery time and acceptable data loss must be assessed and agreed; this overview promises no specific recovery result.
- The proposal confirms covered data, exclusions, retention and any restore or transfer charges.

For your first conversation

- Critical systems and approximate protected data volumes
- Current backup products and retention settings
- Recovery priorities and results of recent restore checks

A summary is enough to start. Do not send passwords, recovery codes or access credentials.
